Capital Flows to MENA Region Resilient to the EM turmoil?

September 17, 2018

Boban Markovic, Research Analyst, bmarkovic@iif.com, +1 202 857 3632 Jonah Rosenthal, Senior Research Analyst, <u>irosenthal@iif.com</u>, +1 202 857 3311 Garbis Iradian, Chief Economist, MENA, giradian@iif.com, +1 202 857 3304

- We see MENA capital flows rising to \$182 billion in 2018 driven by sovereign issuance and banking flows
- Political stability and reforms to improve the business climate remain preconditions for higher FDI inflows
- Higher oil prices, dollar pegs, and large public foreign assets make oil exporters less prone to EM contagion
- Oil importers, however, are showing signs of vulnerability to EM risk aversion and monetary tightening
- Spillovers from Turkey have been limited due to relatively low trade and financial linkages

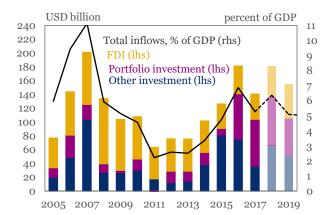

DEBT DRIVEN CAPITAL INFLOWS

Non-resident capital inflows to MENA should rise to \$182 billion in 2018, equivalent to 6% of the region's GDP (Exhibit 1). Downward revision from our March report comes mainly as the Saudi Aramco IPO has stalled. Notwithstanding the revision, the MENA region - particularly oil exporters - is still seeing an increase in foreign inflows this year, unlike other emerging markets (EMs) hampered by global monetary tightening and investors' risk aversion. Resident capital outflows are increasing as well, as the current account surpluses of the GCC countries are improving on the back of higher oil prices. Both portfolio and other investment outflows are on the rise, mainly driven by the SWFs of UAE, Saudi Arabia, and Qatar (Exhibit 2).

The main source of inflows in 2018 remains sovereign bond issuance, as GCC countries raised \$30.5 billion in Eurobonds in the first half of the year. Moving forward, the overall sovereign bond issuance is expected to decrease due to lower financing needs. Nonetheless, the robust performance of GCC primary markets stands out against the broader emerging markets trend, which is lagging behind 2017 levels. This comes as no surprise, as oil exporters present lower risk than other EMs due to their strong fundamentals, while presenting opportunities for regional diversification to bondholders. Expected moderation in portfolio debt inflow will be offset by increased equity inflows on the back of MSCI's scheduled upgrade of Saudi Arabia. Foreign direct investment (FDI) flows are likely to remain subdued in the near term due to political uncertainty in some countries and lack of progress in improving the business environment. FDI inflows in MENA countries remain concentrated in energy and non-tradable sectors and have declined from a peak of 4.2% of GDP in 2008 to 1.5% in 2017.

OIL IMPORTERS: BUMPY ROAD AHEAD

MENA oil importing countries are showing signs of sensitivity to developments across EMs (see Exhibit 13 on page 5). Non-resident capital inflows to MENA oil importers are expected to decline to \$54 billion this year, from \$67 billion in 2017 (Exhibit 3), as global monetary tightening, higher oil prices and external imbalances put MENA oil importers at risk.

Non-resident inflows to Egypt have started to slow.

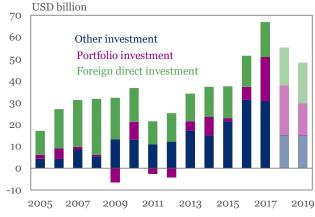

Following the move to a free float in November 2016, capital inflows in Egypt almost doubled to \$43.6 billion last year (FY 2016/17) on the back of higher FDI, disbursement of loans from multilateral organizations, a sharp increase in non-resident purchases of Egyptian securities to take advantage of high domestic interest rates, and issuance of Eurobonds.

We estimate a significant decline in non-resident inflows to \$35 billion in FY 2017/2018, as appetite from foreign investors in the carry trade seems to have peaked earlier this year, and due to less financing need given the narrowing of the twin deficits. Between April and July of this year, \$6.2 billion left Egypt's domestic sovereign debt market amid broader uncertainty battering EMs (Exhibit 4). A jump in yields on Egyptian pound-denominated treasury bills is pushing borrowing costs higher. While the authorities sold \$6.5 billion worth of Eurobonds this year as part of a drive to plug the budget deficit, they cancelled treasury auctions in early September citing unrealistically high rates.

Elsewhere in the region, capital flows to <u>Lebanon</u> are expected to remain nearly flat this year. Non-resident deposit inflows have slowed somewhat in the first half of this year due to the political uncertainty and lack of reforms. However, we expect a sizeable increase in other investments beyond 2018 as the international community pledged more than \$10 billion in concessional loans in April 2018 to help repair the country's ailing infrastructure.

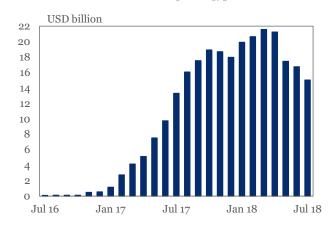

To assess the vulnerability of MENA oil importers to global monetary tightening, we looked at the composition of non-resident capital flows. We define FDI as *sticky money* due to its relatively low sensitivity to exchange rate changes and market sentiment, while other inflows constitute *hot money* more prone to rapid reversal. In essence, as exchange rate pressure increases and investors become more bearish, countries with a higher share of *hot money* in non-resident inflows are at higher risk of capital flight. Our analysis shows that Tunisia, Egypt and Lebanon are particularly vulnerable among oil importers (Exhibit 5). The situation in Tunisia is worrying, as the ongoing IMF program is at risk due to continued weak reforms.

OIL EXPORTERS: BRIGHTER PROSPECTS

MENA oil exporters are showing more resilience to emerging markets turmoil this year than other EM subgroups around the world. Higher oil prices, durable U.S. dollar pegs, relatively low debt levels, and ample foreign reserves make oil exporters less risky and less prone to EM contagion. After a dip in 2017 caused by the rift with Oatar, non-resident capital inflows are expected to rebound across the board and reach \$128 billion this year (Exhibit 6).

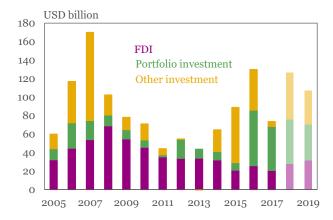

Despite growing EM concerns, appetite for GCC debt was high. Oman and Saudi Arabia issued large tranches of sovereign debt earlier this year in anticipation of higher interest rates (Exhibit 7). After two years, Qatar also returned to international debt markets with a sizable issuance of \$12 billion. Bahrain, however, faced challenges raising capital, as investors called into question the kingdom's ability to meet its growing financing needs. A credible reform package and financial aid from Saudi Arabia, Kuwait, and UAE are preconditions for Bahrain to return to capital markets next year. We expect Eurobond issuance across the region to decline in 2019 as high oil prices reduce financing needs.

MENA oil exporters have witnessed a moderate increase in bond yields this year, but less than other EMs. After one year of moving in unison, yields on GCC dollar denominated bonds diverged to a lower trajectory compared to EMs, indicating lower perceived risk (Exhibit 8). Bahrain has been the only oil exporter with a significant increase in yields on 10y dollar-denominated bonds, rising above 9% before retreating to around 7% on the back of announced support from its neighbors. Notwithstanding high debt issuance, the maturity profile of outstanding international bonds for oil exporters peaks around 2022 and 2027, so significant redemption risk still looks some way off.

Inflows to Qatar and Saudi Arabia are increasing.

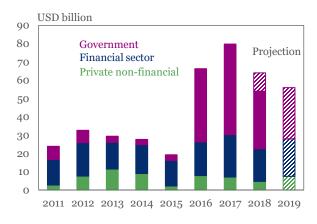

After outflows of \$22bn in 2017 on the back of the rift with other GCC countries, banking flows to Qatar are recovering this year. Inflows of \$9 billion in 2018Q1 are encouraging, with a rebound evident in both non-resident deposits and bank loans (Exhibit 9). Saudi Arabia experienced private sector outflows in early 2018 as the spread between 3-month SAIBOR and 3-month LIBOR tightened. Nonetheless, timely policy rate increases reduced the pressure on capital flows. Additional boosts to capital inflows came from a \$6 billionworth extension of a syndicated loan from 2016, but also from an \$11 billion loan raised recently by the Public Investment Fund (PIF). As prospects of an Aramco IPO remain uncertain, we can expect stronger participation of Saudi Arabia's sovereign entities (including the Public Investment Fund) in international debt markets.

Source: Bloomberg

Following a decade of decline, we expect a modest pickup in FDI inflows. Economic reforms and opening to investors will likely keep the positive trend in years to come. Nevertheless, FDI inflows to MENA oil exporters remain small, projected at 1.2% of GDP in 2018. Political stability and structural reforms to improve governance and the business climate remain preconditions for higher FDI inflows.

Regional equity markets are set to improve. While they have generally had a lackluster performance over the past five years, Kuwait's recent promotion to emerging market status by FTSE, and MSCI's scheduled upgrade of Saudi Arabia next year, produce a positive outlook for equity inflows to the region.

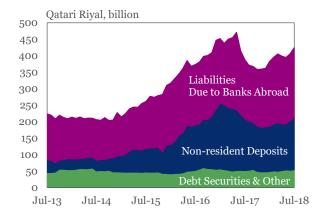

Meanwhile, resident capital outflows are expected to reach \$260 billion this year, driven by the substantial increase in current account surpluses. As in the past, proceeds from higher inflows of petrodollars and affordable international borrowing are being transferred into sovereign wealth funds and invested abroad.

SAUDI MSCI UPGRADE - A POSITIVE SIGNAL

In June 2018, MSCI announced the addition of Saudi Arabia to its Emerging Markets Index. Following three years of reforms and market liberalization, the Kingdom will join the index in the second half of 2019 as the tenth largest constituent with a 2.7% weight. Although Saudi Arabia's Capital Market Authority opened its Qualified Foreign Financial Institutions program to additional investors and liberalized foreign investment limits, foreigners currently own only 2% of the Tadawul, compared to 14% in Abu Dhabi and 9% in Qatar. Addition to the MSCI EM Index would acknowledge Saudi Arabia's reforms, particularly the establishment of a sound stock market system, which should boost confidence among investors and attract large equity inflows.

Given Saudi Arabia's allocated weight and the fact that \$1.9 trillion in assets are benchmarked to the MSCI EM index, we expect inflows of \$10 billion from passive investors. Potential allocation from active investors goes up to \$30-\$40 billion, but the exact allocation is hard to project, as some of the investors will use market liquidity to close their positions. The historical pattern shows that stock markets have rallied following upgrade announcements, as witnessed with UAE and Qatar in 2014 and Pakistan in 2017 (Exhibit 10). Although the Aramco IPO cancellation has affected investors' confidence, we still expect Saudi equities to gain momentum over the next 10 months before facing a correction like other markets in the past. Saudi valuations are attractive relative to historical levels, but they seem stretched on a P/E basis relative to EMs (Exhibit 11). High valuations will likely moderate following the MSCI inclusion next year.

MENA EXPOSURE TO TURKEY IS LIMITED

Contagion from Turkey to date has been relatively limited in the context of trade and capital flows to the MENA region (Exhibit 12). Higher oil prices, pegged currencies in the GCC, low debt, large public foreign assets, and a lower degree of integration into global financial markets make MENA, and particularly GCC, less vulnerable to global macro events. MENA trade exposure to Turkey is fairly negligible excluding Iran which has large exports to Turkey, and Iraq which has large imports (Exhibit 14). While both oil importers and exporters witnessed outflows between April and July, the overal drain of capital is fairly small compared to emerging markets. Against the backdrop of the EM sell-off, Turkish lira depreciation from June to August did not leave notable scars on the region.

Nevertheless, exposure of GCC banks to Turkey merits attention. While GCC banks seem well-capitalized to withstand losses of their Turkish subsidiaries, a few banks from the region have somewhat higher composition of Turkish lira-denominated loans in their portfolios. Given the sharp depreciation of the lira and the prospects for a rise in non-performing loans, pressure on earnings seems inevitable, but the hedging strategies will determine the size of potential losses. The overall performance of the GCC banking sector has been quite good this year compared to the rest of the world (Exhibit 15). Rising interest rates and higher oil prices pushed profits higher in 2018H1, creating a cushion against uncertainty in the second half of the year.
